

IT214 Database Management Systems
Autumn 2020-21

Final Project Report

Section 6 Team 1

Team ID: Section 6 Team 1

Project Title: Blood Bank Database

Team Members and IDs:

1. Visaj Nirav Shah - 201801016
2. Aayush Desai - 201801060
3. Nishant Shah - 201801403
4. Meet Shah - 201801434

Mentor TA: Mr. Nitish Yadav

Section 1: Final Version of SRS

Software Requirements Specification

for

Blood Bank Management Database

Version 4.0

Prepared by Section 6 Group 1

DA-IICT, Gandhinagar

04/12/2020

Revision History

Name	Date	Reason For Changes	Version
SRS V1	26/09/2020	Initial Document	1.0
SRS V2	01/10/2020	Interviews, Questionnaire, System Requirements, etc. added	2.0
SRS V3	03/10/2020	Suggestions of the supervising TA were incorporated, some additional details inserted	3.0
SRS V4	03/12/2020	Final changes incorporated based on the final database design	4.0

A. Introduction

1. Description of the Problem Statement

1.1 Purpose

The main purpose behind this project is to create a blood bank database that can effectively manage the various services and facilities like donor details, staff information, operating hours, and so on provided by a blood bank. This database should encapsulate all the various features available in a real-life equivalent. This is the Version 4 documentation for this product.

The vision behind creating this product is to increase the functionality of blood banks, which is a critical healthcare facility. Blood banks enter the picture in crucial cases where the patient is in critical condition and a quick response is essential. Maintaining an efficient database can help us give such a response with everything stored and organized in our database.

Quite often, customers are not aware of the availability of blood groups at a particular blood bank, they might not know the rules and protocols to be followed, the schedule of blood camps, and so on. Such information can be quickly updated by the staff and made available instantly to the users.

With this product, we also aim to simplify the tasks of staff and management of the blood bank. They can easily access the required data, efficiently query information, make changes and updates to the system, and so on. Given an easy interface and user-friendly platform, even people not well-versed in database management can use the functionalities without much difficulty.

1.2 Intended Audience and Reading Suggestions

The intended audience for this document is mainly software developers working in the Healthline industry. Other users can include the users of this database like database administrators of the blood bank, staff, owners, managers, and so on. People not directly related to this database like the marketing department, customers themselves, etc. can also refer to this document for a better understanding and retrieval of information from the database.

1.3 Product Scope

This feature-heavy database provides multidimensional functionality. It includes features for various kinds of people including customer features like

availability of blood categorized by different blood groups, blood camp, and its location details, report details, other staff member features like blood camp requirements, inventory, and developer features like easy access to database management, efficient querying, central data access point. Such a product should help us improve the current healthcare management infrastructure facilities, especially in government facilities.

1.4 Description

This blood bank database is a self-contained product i.e. it is an independent system in itself without reliance on any other superset database. The product is aimed at servicing one single blood bank and maintaining their data. What are the features that we expect in a blood bank database?

A central database for all the data storage. The entire data of the blood bank right from the inventory to the staff details can be found in a single database. This one-point access system ensures that there are no data inconsistencies, searching and querying is extremely efficient and easy, and so on. This efficiency is essential for a blood bank database because blood banks usually face emergency situations where a delay of a split-second could put someone's life at risk.

Various components of the blood bank ecosystem are connected to a single system. This means that management and transactions in everyday life can be easily assimilated and performed. For example, inventory can easily be updated based on use and camp allotments. This is also beneficial for administrative work and paper-work procedures since everything can be easily submitted and printed from a single software.

Roles and privileges can be easily assigned since the admin can control the various facets of database management directly. One can easily verify or approve data with documents to approve a user for any given role. With such access restrictions and controls in place, the security of the database is maintained since there is an extremely low probability of errors and false updates to the database.

With such authorization functions, many other related functionalities can be provided. For example, employee details, updating sensitive information, and much more can be done in a systematic fashion only by the authorized personnel. Management of such data, which is required almost daily, is made easy, and can be used without specific knowledge of database management.

Inventory can easily be controlled and updated quickly. The staff needs to simply update the incoming and outgoing blood packets so that the inventory is managed properly. In case a particular product is no longer available, it can quickly be ordered or requested from another source. Since data is stored in such a systematic manner, we can quickly guide our efforts in the required directions.

The database can be used to better understand users. For example, how many donors belong to a particular blood group, how many donated at a particular blood donation camp, etc. The blood bank can direct its marketing and awareness efforts accordingly to bring more people to the donation camp and ease the process of supplying blood. Blood banks can be made more accessible since such data can also be posted online for the use of external visitors.

Blood banks are in constant touch with the hospitals for various reasons. Hospitals ask the patient's family to get blood, and hence they work closely with the blood bank. Hospitals keep track of to whom the blood is donated, under the supervision of a doctor. So, in a way, doctoral supervision over the working of the blood bank increases. They can assess the quality of blood, can check the suitability, blood group status, haemoglobin, sugar level, RBC and WBC, platelets, and so on based on the report. This additional supervision is beneficial for both the hospitals and the blood bank.

An important purpose of this database is to develop the current infrastructure in terms of software and utility for the system to be much more efficient. Usually, blood banks are run by the government or trusts, and because of lack of funds, they might not be technologically sufficient for handling such delicate healthcare tasks. With a central database like this, they can expect a certain level of standard. This database is also crucial since we need to maintain such a huge amount of data. The system should be scalable enough to accommodate the increasing number of database users and functions.

This is a SQL database and has a table-relation schema. The fully-functional database will be of assistance to all the components of the blood bank ecosystem - donors, patients, admin, staff, doctors. Let's analyze the various users and their roles, attributes, and so on to better understand their functions.

The database will be of use at every stage of blood donation to blood transfusion. We have identified the following users and their functions in the database. The primary keys are serial in nature.

Donors are important for any blood bank since they ‘supply’ the blood for future use. Donors would register themselves to the database. Each user will be provided with a unique id and password. Their name, address, and contact number are collected so that they can be contacted in future, if needed. They need to be given various details like blood reports, donation details, scheduling updates about future blood donation camps, etc. Donors can set preferences regarding how their blood is used and to whom it can be provided. The preferences that can be set include personal (can be used only for you), relatives (only for relatives), and general (for anyone).

Patients are elements of the hospital database (not directly in the blood bank database), but they are important for the blood bank to keep track of where their supplies go. Name, address, and contact number of patients are maintained in case they are needed at a later stage. The details of donors are kept anonymous for the patient depending on the donor’s preferences.

Staff will be the everyday user of this product, so many of the features are designed keeping them in mind. The staff members will also have a login from which they can easily access, modify and edit the entries of blood donations and blood reports. They will also be able to manage the inventory of blood pouches, injections, blood testing kit, refreshments, etc. which will help in the management of blood camps. They are divided into teams for specific activities like blood donation camps, other duties so that an efficient number of employees are needed and confusion over duties and responsibilities can be avoided. Various positions are available like manager, nurse, wardboy, janitor, compounder based on the roles and responsibilities assigned.

Admin is the overall controller and in-charge of the blood bank. They have the authorization and privileges power to assign roles (and hence access to specific parts of the system). They are also responsible for scheduling blood donation camps and other events for the blood bank.

Doctors are also a key part of this database, they will be able to check the blood availability with some filters, they can request for the required blood and also insert the data about the patients for whom the blood is used. Doctoral supervision is critical and a necessity for proper functioning of blood donation and transfusion activities since a little error on anyone’s part could be a question of life and death for the patient.

The above descriptions talk about the users of the database. Now, we focus on the entities like blood packet, blood report, inventory, and so on that are a part and parcel of the blood bank.

For every blood packet that is donated, we maintain a record by assigning it a unique ID and noting its other details like from which camp it was taken, who was the donor, details of blood sample, etc. Each blood sample received has blood reports associated with it to maintain a record of blood group, haemoglobin levels, and so on for doctor's and patient's use. This donation is then tagged with the person who donated and blood reports of the sample.

The stocks of various items which are used in everyday functioning of the blood bank and in organizing the blood donation camps are maintained. These are extremely useful for the team to get the details of what was used, what was returned, how many syringes, needles remain, etc. Inventory details of each individual camp are also maintained.

The schedule of upcoming and past blood donation camps is available. Donors can check this schedule to plan their blood donation activities accordingly. Team of doctors, nurses, staff, etc. that is assigned to a particular camp can be added so that there is clarity among those associated. This reduces the administrative workload and eliminates confusion.

For each patient who gets the blood from the blood bank, the details of blood transfusion transaction are maintained. These details are of use for blood bank as well as the hospital for their own records. The supervising doctor's details are also added.

Indirect users of the database like the marketing team, public relations team, and so on can also make use of this database by being passive spectators of the data. Although they are not involved in the database, the admin can choose to share the data with them via a static external method.

Fact finding techniques were used for getting an exhaustive list of requirements which need to be incorporated into the database. These techniques included interviewing prospective users (donor, staff, admin, etc.), sending out a questionnaire survey for getting public opinion, compiling various observations from background readings. These enabled us to determine the relations and data that need to be implemented in our product.

B. Requirements Collection and Fact-Finding

1. Background Readings

- https://www.researchgate.net/publication/339032343_Blood_bank_and_Donor_Management_system
- <https://www.sciencedirect.com/science/article/pii/S1877042815036940/pdf?md5=37f01f16137d20d31dcd69d71cc16209&pid=1-s2.0-S1877042815036940-main.pdf>
- <https://www.webmd.com/a-to-z-guides/complete-blood-count#1>
- <https://www.hematology.org/education/patients/blood-basics/blood-banking-and-donation>

2. Information Gathered from Interviews

Interviews

Interview I

Interviewee: Dr. Heena Desai

Designation: Doctor (MBBS)

Interviewer: Mr. Aayush Desai

Designation: Member,
Database Development Team

Date: 27/09/2020

Time: 5 PM

Duration: 30 mins

Purpose of Interview:

- To study the basic requirements needed and problems faced by doctors in the existing system.
- To better understand the role of doctors in the functioning of blood banks.
- Evaluate the current features of such a database and discuss where there is a scope of improvement.

Agenda :

- Understand the required features of the database for doctors.
- Discuss the current modalities of the infrastructure
- Deliberate upon possible improvements and feature-enriching
- Role of doctors

Observations:

1. Login Credentials should be different for the doctors, so they can access it securely.
2. Direct contact details should be available so that doctors can get a quick response.
3. The availability of blood and its details should be easily accessible.

Blood Details:

- A. Blood Group

- B. CBC Measure
 - 1. RBC
 - 2. WBC
 - 3. Hemoglobin
 - 4. Platelets
- 4. Doctors can sort and filter the blood details based on their attributes. When Doctors enter the blood group of the patient they should get details of all the blood groups which can be accepted by the patient.

Interview II

Interviewee: Mr. Meet Shah

Designation: Donor

Interviewer: Mr. Visaj Shah

Designation: Member,
Database Development Team

Date: 29/09/2020

Time: 5 PM

Duration: 40 mins

Purpose of Interview:

- To study the basic requirements needed and problems faced by donors.
- Understand the target audience i.e. donors.

Agenda :

- Understand the required features of the database for donors.
- Inquire about blood donation patterns and frequency of donation.
- Necessary updates regarding reports, schedules, and so on.

Observations:

1. Login credentials must be provided to each donor so that they can securely access their history of donations.
2. Blood banks should take consent from the donor whether they want their details to remain confidential or not.
3. Donors need updates about future blood donation camps to be held.
4. Blood donors want to see the details of their blood donated (i.e whether his/ her blood is deceased or not, allergy).
5. Donors should be able to have their own blood stored in the blood bank for future emergencies. Especially useful for people with specific requirements/ rare blood groups.
6. Donors should have the option of reserving their specific donation for their relatives. For example, blood donated on day X should be given only to their relatives in the future.

Interview III

Interviewee: Mr. Abhilash Kumar

Interviewer: Mr. Nishant Shah

Date: 28/09/2020

Duration: 30 mins

Designation: Admin

Designation: Member,
Database Development Team

Time: 7 PM

Purpose of Interview:

- To study the basic requirements needed by the Admin.
- Understand the blood bank ecosystem - staff details, infrastructure management, storage protocols, and so on.
- Discuss the current system used and what additional modalities are expected from our product

Agenda :

- Understand the required features of the database for Admin.
- Work on the authorization and privileges aspect of the database.
- General discussions regarding the working of the blood bank.

Observations:

1. Send invitation emails for future blood donation camps to donors after it has been at least three months since they last donated.
2. Provision to assign roles to donors, patients, staff, other teams, and so on.
3. Access over the entire database.
4. The requirement of event scheduling rights.

Interview IV

Interviewee: Mr. Aayush Desai

Designation: Staff

Interviewer: Mr. Visaj Shah

Designation: Member,

Database Development Team

Date: 28/09/2020

Time: 7 PM

Duration: 30 mins

Purpose of Interview:

- To study the basic requirements needed by the Staff members of the blood bank.

Agenda :

- Understand the required features of the database for Staff members.

Observations:

1. They are given access to manage the inventory at the blood bank.
2. Staff members can update the blood details of the donors.

2.1 List of Requirements

- Enhance the security of the database
- Support from doctors in terms of quality monitoring
- Proper inventory maintenance
- Tactical division of privileges among different users of the database
- Proper marketing and public relations for publicity and reach

3. Information Gathered from Questionnaire

Questionnaire:-

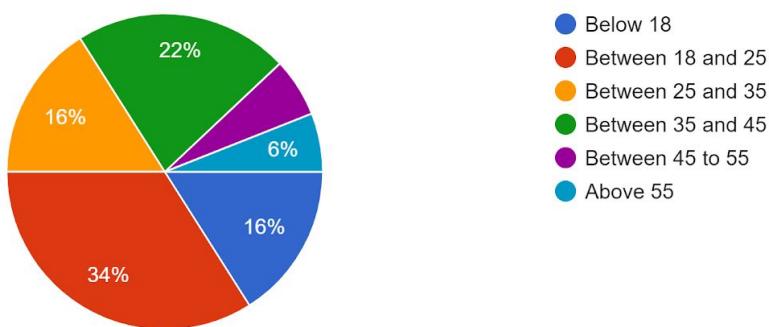

1. **Which age group do you belong to** - (Single Choice)
 - a. Under 18
 - b. Between 18 and 25
 - c. Between 25 and 35
 - d. Between 35 and 45
 - e. Between 45 and 55
 - f. Above 55
2. **How often do you donate blood** - (Single Choice; Only for 18+)
 - a. I have never donated blood
 - b. Between 1-3 times every year
 - c. Between 4-6 times every year
 - d. More than 6 times every year
3. **Do you feel hesitant to donate blood** - (Single Choice; Only for 18+)
 - a. Yes
 - b. No
4. **How often have you used the services of a blood bank** - (Single Choice)
 - a. Never
 - b. 1-3 times
 - c. 4-6 times
 - d. More than 6 times
5. **What problems do you face with the current services provided by blood banks** - (Multiple Choice)
 - a. Very few in number and not easily accessible
 - b. Difficulty in maintaining quality at low costs
 - c. Improper inventory management
 - d. Government policies are not very supportive of the cause
 - e. Administrative procedures and paperwork
 - f. Other (User can enter his own explanation)

6. Suggestions or ideas to better improve the Blood Bank Management System - (short answer)

3.1 Graphs and Charts Based on Responses Collected

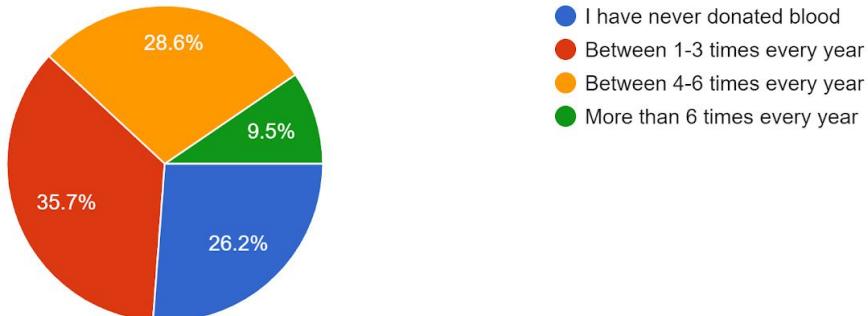

Which age group do you belong to

50 responses

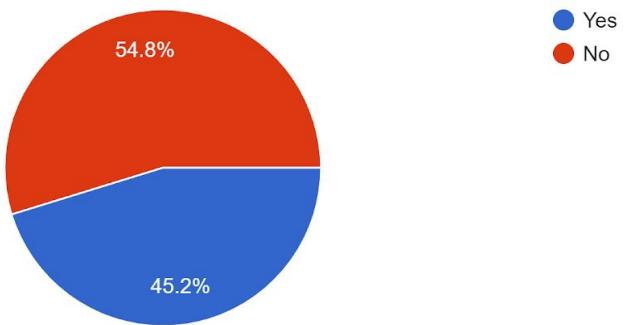

How often do you donate blood?

42 responses

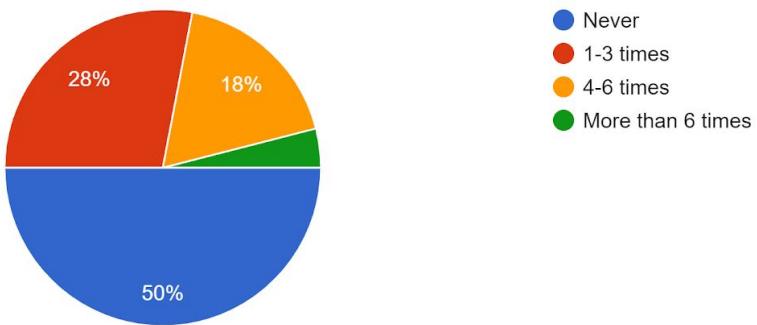

Do you feel hesitant to donate blood?

42 responses

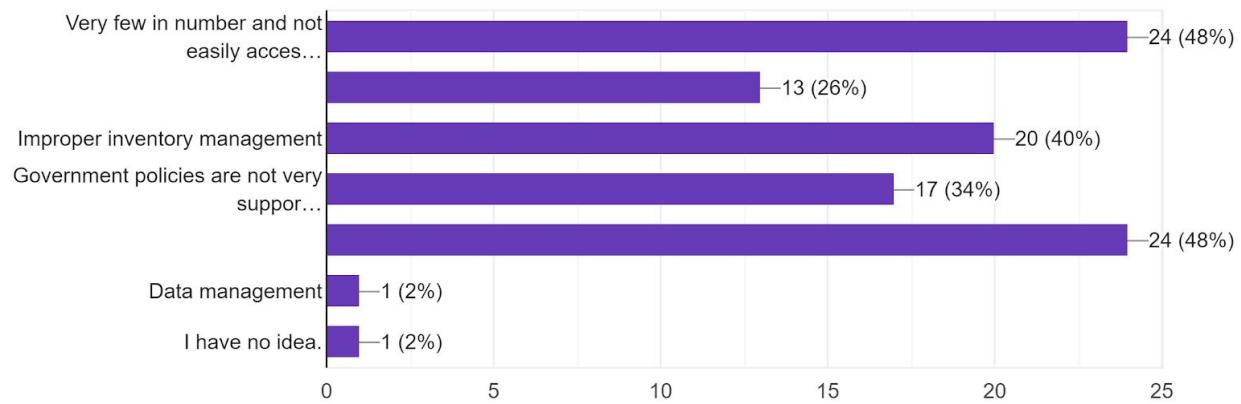

How often have you used the services of a blood bank?

50 responses

What problems do you face with the current services provided by blood banks?

50 responses

Short Answers Received

- Inventory details should be kept open to the public. Also, the schedule of blood camps should be available on a public forum.
- I was hospitalized a while back and some patient next to me could not find a bottle of blood because the hospital blood bank did not intimate him in advance. His situation worsened because of this.
- I want to be able to get enough data about how my donated blood is used, who is the beneficiary, etc.
- We need more doctoral supervision for better quality checks.
- I myself organize some blood donation camps and attend many more. I would like to have better infrastructure and equipment so that the collected samples are healthy and clean.
- I used to work at a blood bank and the database there had many faults. The authorization was faulty, some critical features were missing, etc.
- I want to donate blood but I have never been able to.
- We need to spread awareness about the importance of blood donation

3.2 List of Requirements

- Very few in number and not easily accessible
- Difficulty in maintaining quality at low costs
- Improper inventory management
- Government policies are not very supportive of the cause
- Administrative procedures and paperwork
- Details of the blood camps are updated regularly

4. Observations

4.1 Combined Requirements

- Enhance the security of the database
- Tactical division of privileges among different users of the database
- Doctors must have access to check the availability of the blood at the blood bank.
- Blood bank staff must have authority to enter and update the blood report details of the donor.
- Admin has the right to send mails to donors who have last donated 3 months ago.
- Support from doctors in terms of quality monitoring
- Proper inventory maintenance
- Proper marketing and public relations for publicity and reach
- Very few in number and not easily accessible
- Difficulty in maintaining quality at low costs
- Government policies are not very supportive of the cause
- Administrative procedures and paperwork should be reduced
- Details of the blood camps are updated regularly

C. Fact-Finding Chart

Objective	Technique	Subject(s)	Time commitment
Enhance the security of the Interview database	Interview	Mr. Abhilash Kumar	30 mins
Support from doctors in terms of quality monitoring	Interview	Dr. Heena Desai	30 mins
Proper inventory maintenance	Interview	Mr. Meet Shah	40 mins
Tactical division of privileges among different users of the database	Interview	Mr. Abhilash Kumar	30 mins
Proper marketing and public relations for publicity and reach	Interview	Mr. Abhilash Kumar	30 mins
Very few in number and not easily accessible	Questionnaire	Google Form Respondee	1 min
Difficulty in maintaining quality at low costs	Questionnaire	Google Form	1 min

		Respondent	
Government policies are not very supportive of the cause	Questionnaire	Google Form Respondent	1.5 min
Administrative procedures and paperwork	Questionnaire	Google Form Respondent	1 min
Improper inventory management	Questionnaire	Google Form Respondent	2 min
Details of the blood camps are updated regularly	Questionnaire	Google Form Respondent	3 min

D. List Requirements

1. Final List of Requirements with Frequency

- Reduction of paperwork and administrative procedures, especially in emergency cases (Frequency = 30)
- Precise control of inventory with minimal faults in data (Frequency = 25). This is basically maintained by staff and admin.
- Increase the reach of the blood bank - accessibility and awareness (Frequency = 25).
- Unique privileges based on the position and services offered (Frequency = 21)
- Transparency of data - details of the inventory, schedule of blood donation camps, etc. made available easily (Frequency = 23)
- Increased supervision of operations by doctors (Frequency = 3)
- Improve the current infrastructure and make the systems scalable (Frequency = 4)

E. Users

Donors

- a. Donors can register for Blood Donation.
- b. Donors are asked to enter their medical details.
 - Blood Group (required*)
 - Past Blood Reports
 - Medical History
- c. The access to view the past history of their own blood donations.
- d. Not allowed to access to view other donor's data.
- e. Blood Donation type

- Self
 - Family Member
 - Open to all
- f. Donors are updated regularly about the upcoming Blood Donation Camps.

Admin

- a. They are allowed to maintain the entire database. They can make necessary updates and deletions in the database.
- b. They have the authority to assign roles like Doctor, Donor, etc. in the databases. They can even revoke the roles under certain circumstances.

Staff

- a. They have the right to view the data of all the donors and the recipients.
- b. They have access to enter the blood report of the Donor.
- c. They can't change the personal details which are entered by the donor or the patient.
- d. They are authorized to maintain the request by the doctors.

Doctors

- a. They can view the data of blood availability(blood group-wise).
- b. They are allowed to request the blood if needed.
- c. They don't have any information about the donors.
- d. Doctors can enter details of the patient for whom he has requested the blood.

F. Operating Requirements

Hardware Requirements

- Can be accessed from any device which has internet connectivity.

Software Requirements

- We have used SQL.

G. Product Function

- Donors should be allowed to enter personal and medical details.
- Donors can get themselves registered for blood donation.
- Donors are updated about the future blood donation camps.
- Past blood donation details of donors are made accessible of their own.
- Bank your own blood.
- Reserve their own blood for their relatives.
- Staff members can update blood details of donors.
- Staff members can manage the inventory at the blood bank.
- Admin has rights for manual updates if needed.
- Admin has event scheduling rights.
- Admin assigns roles such as Doctors, Staff, Donors.
- It should allow updates when a patient uses blood or a donor donates blood.
- History of all the patients and Donors.
- Doctors will get unique login credentials for security.
- Doctors have contact details of the highest authority of the blood bank for quick response.
- Doctors can view the blood availability data. They have a filter facility.
- Doctors are able to request the blood for the patient.

H. Privileges

Donors

- a. They can register themselves.
- b. View the history of their Blood Donations.
- c. Updates on the upcoming Blood Donation camps.

Admin

- a. He can intervene for manual updates in the database in critical conditions.
- b. He has the right to view the entire database.

Staff

- a. Enter the Blood report of the Donor.

- b. View the entire data.
- c. They maintain requests of blood from the Doctors.

Doctors

- a. Request for the Blood.
- b. View the Blood availability details.
- c. Can request for the blood.

I. Assumptions

- Isolated Model
 - We are assuming no interactions with other blood banks.
- Individual donations, not made in the blood camp, are not accepted.
- A part of a blood packet, not necessarily the whole, can be given to the patient.
- There is no expiry limit for a blood packet donated.

J. Business Constraints

- There are no business constraints.

Section 2: Final Noun Analysis

TABLE 1: Nouns and Verbs in Description

NOUN	VERB
PERSON	DONATION
CREDENTIALS	ORDER
DONOR	SUPPLY
BLOOD PACKET	REQUEST
BLOOD REPORT	TRANSFUSION
PATIENTS	
DOCTOR	
STAFF	
BLOOD DONATION CAMP	
INVENTORY	
STOCKS (BLOOD BANK INVENTORY)	
TEAM	
ITEM	
EMPLOYEE	
BOTTLES	
BLOOD GROUP	
EXTERNAL VISITORS

DESIGNATION	

TABLE 2: Entities, Relations, and Attributes in Database

Candidate Entity Set	Candidate Attribute Set	Candidate Relationship Set
ADMIN	<ul style="list-style-type: none"> • <u>ADMIN_ID</u> • NAME • ADDRESS • MOBILE • USERNAME • PASSWORD 	
DONOR	<ul style="list-style-type: none"> • <u>DONOR_ID</u> • NAME • ADDRESS • MOBILE • USERNAME • PASSWORD 	<ul style="list-style-type: none"> • DONOR donates BLOOD PACKET
BLOOD PACKET	<ul style="list-style-type: none"> • <u>PACKET_ID</u> • CAPACITY 	<ul style="list-style-type: none"> • CAMP_DETAILS (with BLOOD DONATION CAMP)

	<ul style="list-style-type: none"> • CAMP_ID • DONOR_ID • USAGE_TYPE 	<ul style="list-style-type: none"> • REPORT_OF (with BLOOD REPORT) • DETAILS_OF_PACKET (with TRANSFUSION) • DONOR donates BLOOD PACKET
BLOOD REPORT	<ul style="list-style-type: none"> • REPORT_ID • PACKET_ID • BLOOD_GROUP • RBC_COUNT • WBC_COUNT • PLATELETS • SUGAR_LEVEL • HAEMOGLOBIN • TIME_STAMP 	<ul style="list-style-type: none"> • REPORT_OF (with BLOOD PACKET) • REPORT_DATA (with DONATION)
PATIENT	<ul style="list-style-type: none"> • PATIENT_ID • NAME • ADDRESS • MOBILE 	
DOCTOR	<ul style="list-style-type: none"> • DOCTOR_ID • NAME • ADDRESS • MOBILE • USERNAME • PASSWORD 	<ul style="list-style-type: none"> • DETAILS_OF_DOCTOR (with TRANSFUSION)
STAFF	<ul style="list-style-type: none"> • STAFF_ID • SALARY • POSITION • DATE_OF_JOINING • NAME • ADDRESS • MOBILE • USERNAME • PASSWORD 	<ul style="list-style-type: none"> • WITH_STAFF(WITH TEAM)
BLOOD	<ul style="list-style-type: none"> • CAMP_ID 	<ul style="list-style-type: none"> • CAMP_DETAILS (with

DONATION CAMP	<ul style="list-style-type: none"> • EVENT_DATE • LOCATION • START_TIME • END_TIME 	<ul style="list-style-type: none"> BLOOD PACKET) • WITH_TEAM (with TEAM) • FOR_CAMP (with INVENTORY)
INVENTORY	<ul style="list-style-type: none"> • <u>CAMP_ID</u> • <u>ITEM_ID</u> • COUNT 	<ul style="list-style-type: none"> • FOR_CAMP (with BLOOD DONATION CAMP) • ITEM_NAME (with ITEM)
TEAM	<ul style="list-style-type: none"> • <u>CAMP_ID</u> • <u>STAFF_ID</u> 	<ul style="list-style-type: none"> • WITH_TEAM (with BLOOD DONATION CAMP) • WITH_STAFF(WITH STAFF)
ITEM	<ul style="list-style-type: none"> • <u>ITEM_ID</u> • NAME • TYPE • ITEM_COUNT • PRICE 	<ul style="list-style-type: none"> • ITEM_NAME (with INVENTORY)
TRANSFUSION	<ul style="list-style-type: none"> • PACKET_ID • PATIENT_ID • <u>DOCTOR_ID</u> • <u>TIME_STAMP</u> 	<ul style="list-style-type: none"> • DETAILS_OF_PATIENT (with PATIENT) • DETAILS_OF_DOCTOR (with DOCTOR) • DETAILS_OF_PACKET (with BLOOD PACKET)

TABLE 3: Rejected Nouns with Reason

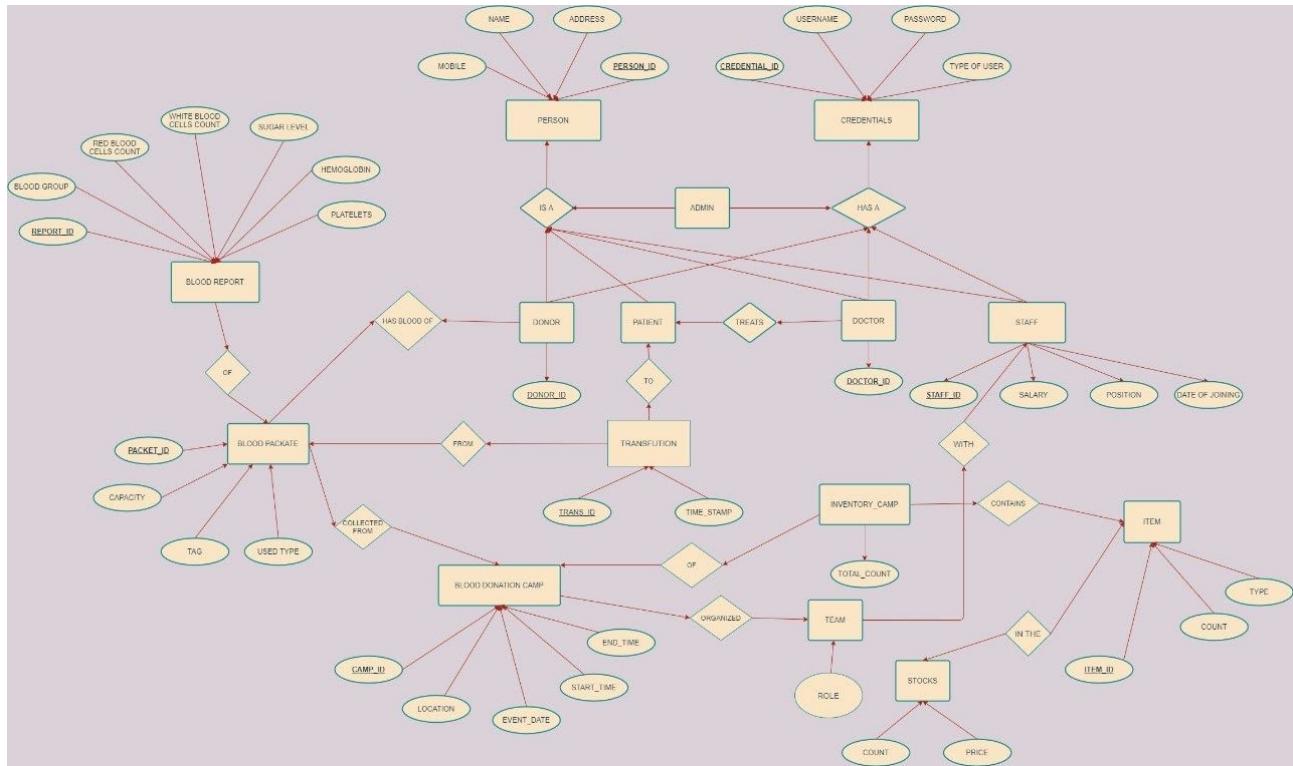

REJECTED NOUN	REJECTION REASON
PERSON	Each role like donor, patient, etc. is used separately
EMPLOYEE	Employee and staff have same role
BOTTLES	Bottles, blood pouches, packets are all similar

EXTERNAL VISITORS	No active use in the database
HOSPITAL	Not directly related
GOVERNMENT	Not required
FUND	Funds are not considered
USERS	Similar to person
INJECTIONS	Will come under ITEM
BLOOD TESTING KIT	Will come under ITEM
REFRESHMENTS	Will come under ITEM
ROLES	Equivalent to DESIGNATION in CREDENTIALS
BLOOD BANK	Database for a single blood bank
CENTRAL DATABASE	No other external database is used or needed
STAFF DETAILS	Covered under STAFF
ACCESS SYSTEM	Not related
COMPONENTS	Equivalent to DESIGNATION in CREDENTIALS
BLOOD BANK ECOSYSTEM	Not related
PRIVILEGES	Equivalent to DESIGNATION in CREDENTIALS
FACETS	Not related
DOCUMENTS	Similar to BLOOD REPORT
DOCTOR DETAILS	Equivalent to DOCTOR
PATIENT DETAILS	Equivalent to PATIENT
SQL DATABASE	No other external database is used

	or needed
DONATION DETAILS	Equivalent to DONATION
POUCHES	Bottles, blood pouches, packets are all similar
CREDENTIALS	Allotted individually to each user

Section 3: Final ER Diagrams - All Versions

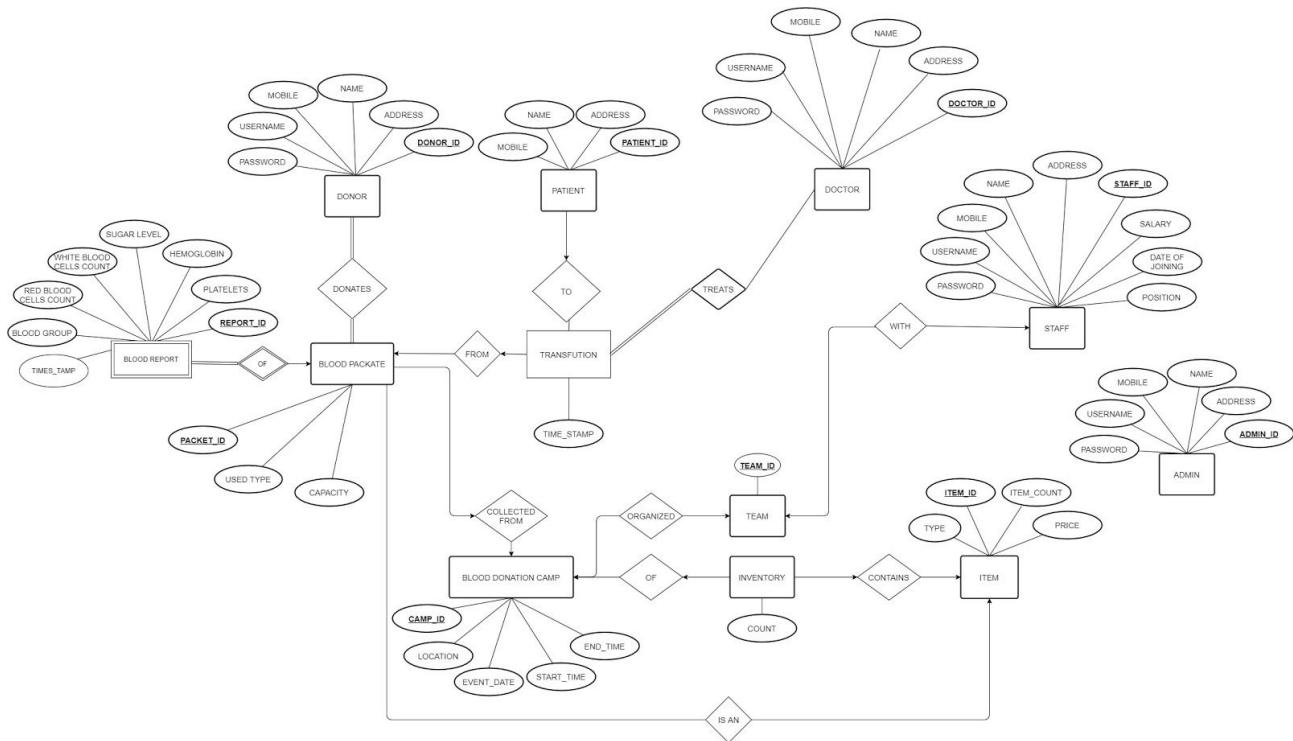

Version 1:

Version 2:

Version 3 - Final:

Section 4: Conversion of Final ER Diagram to Relational Model

Relational Model (before schema refinement and normalization):

Admin(ADMIN_ID,Username,Password,NAME, ADDRESS, MOBILE)
Donor (Donor_ID, Username, Password, Name, Address, Mobile)
Doctor (Doctor_ID,Username,Password,Name,Address,Mobile)
Staff
(Staff_ID,Username,Password,Salary,Credentials_ID,Position,Date_of_joining,Name,Address,Mobile)
Patient (Patient_ID,Doctor_ID,Name,Address,Mobile)
Item(Item_ID,Name, Type, Item_Count)
Inventory (Camp_ID,Item_ID,Count)
Donation_Camp (Camp_ID,Event_date,Location,Start_time,End_time)
Team (Team_ID,Staff_ID, CAMP_ID)
Blood_Packet (Packet_ID,Capacity, Camp_ID, Donor_ID, Usage_Type,Item_ID)
Blood_Report (Report_ID,Packet_ID,Platelets,Hemoglobin,Sugar_level,WBC,RBC,Blood_group)
Transfusion(Trans_ID, Packet_ID,Patient_ID, Doctor_ID, Time_Stamp)

Section 5: Normalization and Schema Refinement

Functional Dependency and Anomalies in original schema

- 1) ADMIN_ID -> NAME, ADDRESS, USERNAME, PASSWORD, MOBILE
 - BCNF
- 2) Donor_ID -> Username, Password, Name, Address, Mobile
 - BCNF
- 3) Doctor_ID -> Username, Password, Name, Address, Mobile
 - BCNF
- 4) Staff_ID -> Username, Password, Salary, Position, Date_of_joining, Name, Address, Mobile
 - BCNF
- 5) (Patient_ID) -> Name, Address, Mobile
 - BCNF
- 6) Item_ID -> Name, Type, Item_Count, price
 - BCNF
- 7) (Camp_ID, Item_ID) -> Count
 - BCNF

- 8) Camp_ID -> Event_date, Location, Start_time, End_time
 - BCNF
- 9) (Staff_ID, CAMP_ID)
 - BCNF
- 10) Packet_ID -> Capacity, Camp_ID, Donor_ID, Usage_Type
 - BCNF
- 11) Report_ID ->
 Packet_ID, Platelets, Hemoglobin, Sugar_level, WBC, RBC, Blood_group, TIME_STAMP
 - BCNF
- 12) Trans_ID -> Patient_ID, Doctor_ID, TIMESTAMP
 (Patient_ID, Doctor_ID) -> TIMESTAMP
- This is not in 3rd normal form because Trans_ID defines (Patient_ID, Doctor_ID) and (Patient_ID, Doctor_ID) defines TIMESTAMP.
 - For this we REMOVE TRANS_ID and make DOCTOR_ID and TIME_STAMP as primary keys..
 - After this it comes in BCNF

FINAL SCHEMA

Admin(ADMIN_ID, Username, Password, NAME, ADDRESS, MOBILE)
 Donor (Donor_ID, Username, Password, Name, Address, Mobile)
 Doctor (Doctor_ID, Username, Password, Name, Address, Mobile)
 Staff
 (Staff_ID, Username, Password, Salary, Credentials_ID, Position, Date_of_joining, Name, Address, Mobile)
 Patient(Patient_ID, Name, Address, Mobile)
 Item(Item_ID, Name, Type, Item_Count)
 Inventory (Camp_ID, Item_ID, Count)
 Donation_Camp (Camp_ID, Event_date, Location, Start_time, End_time)
 Team (Staff_ID, CAMP_ID)
 Blood_Packet (Packet_ID, Capacity, Camp_ID, Donor_ID, Usage_Type, Item_ID)
 Blood_Report
 (Report_ID, Packet_ID, Platelets, Hemoglobin, Sugar_level, WBC, RBC, Blood_group, TIME_STAMP)
 Transfusion(Doctor_ID, TIME_STAMP, Packet_ID, Patient_ID)

```

SQL Queries and Their Snapshots:

CREDENTIALS:

```
1. SELECT DONOR_ID  
FROM DONOR  
WHERE USERNAME = 'ndugo1' AND PASSWORD = 'cFy7IAASjz4m';
```

The screenshot shows the pgAdmin 4 interface. The left sidebar is a tree view of database objects under the schema 'blood_bank'. The 'Tables' node is expanded, showing 'donor' as the selected table. The main pane contains a query editor with the following SQL code:

```
1 SELECT DONOR_ID  
2 FROM DONOR  
3 WHERE USERNAME = 'ndugo1' AND PASSWORD = 'cFy7IAASjz4m';
```

The results pane shows a single row of data from the 'donor' table:

donor_id	[PK] integer
1	2

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 406 msec. 1 rows affected."

DETAILS:

2. **SELECT NAME, ADDRESS, MOBILE**

FROM STAFF

WHERE USERNAME = 'F5bvYiv' AND PASSWORD = 'XIJ93GGM3OY';

The screenshot shows the PgAdmin 10 interface. The left sidebar is a tree view of database objects, including sequences, tables, trigger functions, types, views, and a selected table named 'blood_bank'. The main area contains a query editor window with the following SQL code:

```
1 SELECT NAME, ADDRESS, MOBILE
2 FROM STAFF
3 WHERE USERNAME = 'F5bvYiv' AND PASSWORD = 'XIJ93GGM3OY';
```

Below the query editor is a data output table with three columns: name, address, and mobile. A single row is displayed for 'Jillian' with the values: P.O. Box 909, 6687 Curabitur St. and 4727768601. A green success message at the bottom right indicates the query was run successfully.

name	address	mobile
Jillian	P.O. Box 909, 6687 Curabitur St.	4727768601

✓ Successfully run. Total query runtime: 349 msec. 1 rows affected.

DONOR COUNT: (TOTAL COUNT OF DONORS)

3. `SELECT COUNT(DONOR_ID) FROM DONOR;`

The screenshot shows the pgAdmin 4 interface. The left sidebar displays a tree view of database objects under the schema 'blood_bank'. The 'Tables' node is expanded, showing 'admin', 'blood_packet', 'blood_report', 'doctor', 'donation_camp', and 'donor'. The 'Query Editor' tab is active, containing the SQL query: `SELECT COUNT(DONOR_ID) FROM DONOR;`. The 'Data Output' tab shows the result of the query: a single row with a column named 'count' containing the value '100'. A green status bar at the bottom right indicates: `Successfully run. Total query runtime: 255 msec. 1 rows affected.`

count	bigint
1	100

STOCK DETAILS: (DETAILS OF ALL STOCK AVAILABLE AT THE BLOOD BANK)

4. SELECT * FROM ITEM;

The screenshot shows the pgAdmin interface with the following details:

- Toolbar:** File, Object, Tools, Help.
- Browser:** Shows the database structure under "blood_bank".
- Query Editor:** Contains the SQL query: `SELECT * FROM ITEM;`
- Data Output:** A table showing the results of the query. The columns are: item_id, name, type, item_count, and price.
- Messages:** A green message at the bottom right says: "Successfully run. Total query runtime: 345 msec. 13 rows affected."

item_id	name	type	item_count	price
1	Gloves	Plastic	600	20
2	Gloves	Rubber	100	40
3	Syringe	5mm	2300	50
4	Syringe	10mm	1500	75
5	Injection	10ml	2000	30
6	Injection	50ml	1000	60
7	Blood_pouch	100ml	200	300
8	Blood_pouch	200ml	30	500
9	Blood_pouch	300ml	500	600

DONATION CAMP ARRANGED:(DETAILS OF ALL THE CAMPS CONDUCTED TILL NOW)

5. SELECT DISTINCT LOCATION FROM DONATION_CAMP;

The screenshot shows the pgAdmin 4 interface. The left sidebar displays a tree view of database objects under the schema 'blood_bank'. The 'Tables' node is expanded, showing 'donation_camp' as one of the tables. The main area contains a query editor window with the following content:

```
1 SELECT DISTINCT location FROM DONATION_CAMP;
```

The results are displayed in a Data Output tab:

location
character varying (100)
1 Chicago
2 Mumbai
3 Los Angeles
4 Delhi
5 Kolkata
6 Ahmedabad

A green message bar at the bottom right indicates: ✓ Successfully run. Total query runtime: 221 msec. 6 rows affected.

TOTAL BLOOD AVAILABLE AT BANK:

6. SELECT SUM(CAPACITY) FROM BLOOD_PACKET;

The screenshot shows the PgAdmin 4 interface. The left sidebar displays a tree view of database objects under the schema 'blood_bank'. The 'Tables' node is expanded, showing 'blood_packet' as one of the twelve tables. The main area contains a 'Query Editor' tab with the following SQL query:

```
1 SELECT SUM(CAPACITY) FROM BLOOD_PACKET;
```

The 'Data Output' tab shows the result of the query:

sum
bigint
1 59300

A green success message at the bottom right of the interface states: "Successfully run. Total query runtime: 452 msec. 1 rows affected."

POSITIONS IN THE STAFF:(DIFFERENT POSITIONS AVAILABLE AT THE BLOOD BANK)

7. SELECT DISTINCT POSITION FROM STAFF;

The screenshot shows the PgAdmin 4 interface. The left sidebar displays a tree view of database objects under the 'blood_bank' schema, including tables like 'admin', 'blood_packet', 'blood_report', 'doctor', 'donation_camp', and 'donor'. The main area shows a query editor with the following SQL code:

```
1 SELECT DISTINCT POSITION FROM STAFF;
```

The results are displayed in a Data Output tab, showing a single column named 'position' with the following values:

position
character varying (20)
1 Wardboy
2 Storekeeper
3 Manager
4 Nurse
5 Janitor
6 Compounder

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 291 msec, 6 rows affected."

HOW MANY TIMES A PATIENT NEEDED BLOOD:

8. **SELECT PATIENT_ID,COUNT(*)
FROM TRANSFUSION
GROUP BY PATIENT_ID;**

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database schema with the 'blood_bank' table selected. The main area contains a query editor with the following SQL code:

```
1 SELECT PATIENT_ID , COUNT(*)
2 FROM TRANSFUSION
3 GROUP BY PATIENT_ID;
```

The results are displayed in a table titled 'Data Output' with the following data:

	patient_id	count
1	55	1
2	27	3
3	23	5
4	56	1
5	91	1
6	58	3
7	8	3
8	87	1
9	74	1

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 373 msec. 100 rows affected."

GET THE CAPACITIES OF BLOOD DONATED BY EACH DONOR HAVING USAGE_TYPE EQUAL TO RELATIVES:

9. WITH DONOR_DETAILS AS

```
(SELECT DONOR.DONOR_ID AS DONOR_ID, SUM(CAPACITY) AS TOT_CAP
FROM DONOR INNER JOIN BLOOD_PACKET ON
DONOR.DONOR_ID=BLOOD_PACKET.DONOR_ID
WHERE USAGE_TYPE = 'Relatives'
GROUP BY DONOR.DONOR_ID )
```

```
SELECT DONOR.DONOR_ID,NAME, MOBILE, TOT_CAP
FROM DONOR INNER JOIN DONOR_DETAILS ON
DONOR.DONOR_ID=DONOR_DETAILS.DONOR_ID;
```

The screenshot shows the pgAdmin 4 interface with a query editor window open. The browser pane on the left shows the database structure, including servers, databases, catalogs, and tables. The query editor pane contains two SQL statements. The first statement creates a temporary view 'DONOR_DETAILS' with a single column 'DONOR_ID'. The second statement uses this view in a subquery to calculate the total capacity for donors where the usage type is 'Relatives'. The final SELECT statement joins the original 'DONOR' table with the 'DONOR_DETAILS' view based on 'DONOR_ID'.

```

1 WITH DONOR_DETAILS AS
2   (SELECT DONOR.DONOR_ID AS DONOR_ID, SUM(CAPACITY) AS TOT_CAP
3    FROM DONOR INNER JOIN BLOOD_PACKET ON DONOR.DONOR_ID=BLOOD_PACKET.DONOR_ID
4    WHERE USAGE_TYPE = 'Relatives'
5    GROUP BY DONOR.DONOR_ID )
6
7 SELECT DONOR.DONOR_ID,NAME, MOBILE, TOT_CAP
8 FROM DONOR INNER JOIN DONOR_DETAILS ON DONOR.DONOR_ID=DONOR_DETAILS.DONOR_ID;
9

```

The data output pane shows a table with columns: donor_id, name, mobile, and tot_cap. The data is as follows:

donor_id	name	mobile	tot_cap
1	87 Freeman Woring	8202111413	300
2	74 Hermy Betchley	2590611986	300
3	54 Eddie Delahunt	5527129220	500
4	29 Rutter McGurk	2401755807	600
5	71 Ewell O'Reilly	3981037697	200
6	68 Sashenka Bento	9922387759	200
7	34 Shelagh Grimal	356045946	400

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 486 msec. 75 rows affected."

THIS QUERY RETURNS ALL THE NAMES OF THE PATIENTS WHO HAVE RECEIVED BLOOD MORE THAN EQUAL TO 2.

```
10. SELECT PATIENT.PATIENT_ID,NAME  
    FROM PATIENT  
    INNER JOIN TRANSFUSION ON PATIENT.PATIENT_ID=TRANSFUSION.PATIENT_ID  
    GROUP BY PATIENT.PATIENT_ID  
    HAVING COUNT(*) >= 2;
```

The screenshot shows the PgAdmin 10 interface. The left sidebar displays the database structure under 'Servers' and '201801403_db'. The 'blood_bank' schema is selected. The main area contains the query editor with the following SQL code:

```
1  SELECT PATIENT.PATIENT_ID,NAME  
2  FROM PATIENT  
3  INNER JOIN TRANSFUSION ON PATIENT.PATIENT_ID=TRANSFUSION.PATIENT_ID  
4  GROUP BY PATIENT.PATIENT_ID  
5  HAVING COUNT(*) >= 2;
```

The results are displayed in a table titled 'Data Output':

	patient_id	name
1	27	Jorey
2	23	Althea
3	58	Bernie
4	8	Gillie
5	54	Elvira
6	71	Karen
7	68	Annonnia

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 207 msec. 79 rows affected."

GET THE TOTAL COLLECTED BLOOD HAVING DIFFERENT BLOOD GROUPS

```
11. SELECT BLOOD_GROUP, SUM(CAPACITY)
   FROM BLOOD_PACKET
   INNER JOIN BLOOD_REPORT ON
BLOOD_PACKET.PACKET_ID=BLOOD_REPORT.PACKET_ID
   GROUP BY BLOOD_GROUP;
```

The screenshot shows the pgAdmin 4 interface. On the left is a tree view of database objects under 'Servers (1)'. A node for 'blood_bank' is selected. The main area contains a 'Query Editor' tab with the following SQL code:

```
1 SELECT BLOOD_GROUP, SUM(CAPACITY)
2 FROM BLOOD_PACKET
3 INNER JOIN BLOOD_REPORT ON BLOOD_PACKET.PACKET_ID=BLOOD_REPORT.PACKET_ID
4 GROUP BY BLOOD_GROUP;
5
```

Below the code, the 'Data Output' tab is active, displaying a table with the results:

blood_group	sum
B+	6900
O-	9800
AB+	14400
AB-	9800
A+	3700
O+	9000
R-	8100

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 488 msec. 8 rows affected."

SPECIFIC BLOOD GROUP CAPACITY (i.e., A+)

```
12. SELECT BLOOD_GROUP, SUM(CAPACITY) AS CAPACITY  
    FROM BLOOD_PACKET  
    INNER JOIN BLOOD_REPORT ON  
        BLOOD_PACKET.PACKET_ID=BLOOD_REPORT.PACKET_ID  
    WHERE BLOOD_GROUP = 'A+'  
    GROUP BY BLOOD_GROUP;
```

The screenshot shows the PgAdmin 4 interface. The left sidebar displays the database schema, including servers, databases, catalogs, and schemas like 'blood_bank'. The main area shows a query editor with the following SQL code:

```
1 SELECT BLOOD_GROUP, SUM(CAPACITY) AS CAPACITY  
2 FROM BLOOD_PACKET  
3 INNER JOIN BLOOD_REPORT ON BLOOD_PACKET.PACKET_ID=BLOOD_REPORT.PACKET_ID  
4 WHERE BLOOD_GROUP = 'A+'  
5 GROUP BY BLOOD_GROUP;  
6  
7
```

Below the query editor, the results are displayed in a table:

blood_group	capacity
A+	3700

A message at the bottom right indicates: "Successfully run. Total query runtime: 195 msec. 1 rows affected."

NAME OF ALL THE STAFF MEMBERS WHICH ARE PART OF THE CAMPS CONDUCTED IN AHMEDABAD

```
13. SELECT DISTINCT NAME  
    FROM DONATION_CAMP  
    INNER JOIN TEAM ON DONATION_CAMP.CAMP_ID = TEAM.CAMP_ID  
    INNER JOIN STAFF ON TEAM.STAFF_ID = STAFF.STAFF_ID  
    WHERE LOCATION = 'Ahmedabad';
```

The screenshot shows the PgAdmin 10 interface. The left sidebar displays the database structure under 'Servers' and '201801403_db'. The 'Query Editor' tab contains the following SQL code:

```
1 SELECT DISTINCT NAME  
2 FROM DONATION_CAMP  
3 INNER JOIN TEAM ON DONATION_CAMP.CAMP_ID = TEAM.CAMP_ID  
4 INNER JOIN STAFF ON TEAM.STAFF_ID = STAFF.STAFF_ID  
5 WHERE LOCATION = 'Ahmedabad';
```

The 'Data Output' tab shows the results of the query:

name
Alvin
Amelia
Callie
Dalton
Hyacinth
Jamal
Illian

A green success message at the bottom right indicates: "Successfully run. Total query runtime: 280 msec. 9 rows affected."

GET THE NAMES AND CONTACT NUMBER OF DONORS HAVING LESS THAN 11 HEMOGLOBIN LEVEL

14. SELECT NAME, MOBILE

```
FROM DONOR INNER JOIN BLOOD_PACKET
ON DONOR.DONOR_ID = BLOOD_PACKET.DONOR_ID
INNER JOIN BLOOD_REPORT
ON BLOOD_PACKET.PACKET_ID = BLOOD_REPORT.PACKET_ID
WHERE CAST(HAEMOGLOBIN AS DECIMAL) < 11;
```

The screenshot shows the pgAdmin 10 interface. The left sidebar displays the database structure under 'Servers (1)'. The 'blood_bank' schema is selected. The main area contains the SQL query:

```
1 SELECT NAME, MOBILE
2 FROM DONOR INNER JOIN BLOOD_PACKET
3 ON DONOR.DONOR_ID = BLOOD_PACKET.DONOR_ID
4 INNER JOIN BLOOD_REPORT
5 ON BLOOD_PACKET.PACKET_ID = BLOOD_REPORT.PACKET_ID
6 WHERE CAST(HAEMOGLOBIN AS DECIMAL) < 11;
7
```

The results are displayed in a table titled 'Data Output' with columns 'name' and 'mobile'. The output shows 54 rows of donor information. A green message bar at the bottom right indicates the query was successfully run.

	name	mobile
1	Barron Le Marchand	8371745200
2	Valentino Ghirardi	8853715107
3	Eddie Delahunt	5527129220
4	Sashenka Bento	9922387759
5	Freeman Worling	8202111413
6	Noreen Vinick	2755408422
7	Mil Pitts	8756952449

Successfully run. Total query runtime: 223 msec. 54 rows affected.

TO GET THE DETAILS OF ALL THE BLOOD DONATION MADE BY PARTICULAR PERSON:

```
15. SELECT REPORT_ID, PLATELETS, HAEMOGLOBIN, SUGAR_LEVEL, WBC_COUNT,  
      RBC_COUNT  
      FROM BLOOD_PACKET  
      INNER JOIN BLOOD_REPORT ON  
      BLOOD_PACKET.PACKET_ID=BLOOD_REPORT.PACKET_ID  
      WHERE DONOR_ID = 70;
```

The screenshot shows the PgAdmin 4 interface. The left sidebar displays the database structure under 'Servers (1) > PostgreSQL 10 > Databases (2) > 201801403_db'. The 'Query Editor' tab contains the following SQL code:

```
1 SELECT REPORT_ID, PLATELETS, HAEMOGLOBIN, SUGAR_LEVEL, WBC_COUNT  
2 FROM BLOOD_PACKET  
3 INNER JOIN BLOOD_REPORT ON BLOOD_PACKET.PACKET_ID=BLOOD_REPORT.PACKET_ID  
4 WHERE DONOR_ID = 70;
```

The 'Data Output' tab shows the results of the query:

report_id	platelets	haemoglobin	sugar_level	wbc_count	rbc_count
1	174	361688	15.4	130	5002
2	302	268583	14.4	134.3	11878
3	338	397033	14.3	146	6211

A green message bar at the bottom right indicates: ✓ Successfully run. Total query runtime: 196 msec. 3 rows affected.

TO GET ALL THE DONORS WHO HAVE DONATED MORE THAN 3 TIMES:

```
16. SELECT DONOR.DONOR_ID,NAME  
    FROM DONOR  
    INNER JOIN BLOOD_PACKET ON BLOOD_PACKET.DONOR_ID=DONOR.DONOR_ID  
    GROUP BY DONOR.DONOR_ID  
    HAVING COUNT(PACKET_ID) > 3;
```

The screenshot shows the pgAdmin 4 interface. On the left is a tree view of database objects under 'Servers (1)'. A selected node is 'blood_bank' under 'Databases (2)'. The main area contains a 'Query Editor' tab with the following SQL code:

```
1 SELECT DONOR.DONOR_ID,NAME  
2 FROM DONOR  
3 INNER JOIN BLOOD_PACKET ON BLOOD_PACKET.DONOR_ID=DONOR.DONOR_ID  
4 GROUP BY DONOR.DONOR_ID  
5 HAVING COUNT(PACKET_ID) > 3;  
6
```

Below the query editor is a table titled 'Data Output' with two columns: 'donor_id' and 'name'. The data is as follows:

donor_id	name
1	Nessa Barthelme
2	Man Matysik
3	Glenden Leishman
4	Eddie Barribal
5	Avictor Kingsley
6	Freeman Worling
7	Harmy Ratchlev

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 298 msec. 35 rows affected."

CITY RANKING

17. CREATE OR REPLACE VIEW DONATIONS_PACKETS AS
SELECT * FROM DONATION_CAMP NATURAL JOIN BLOOD_PACKET;
SELECT * FROM DONATIONS_PACKETS;

The screenshot shows the pgAdmin 4 interface. On the left, the 'Browser' pane displays the database structure under 'Servers (1) > PostgreSQL 10 > 201801403_db > Schemas (3) > blood_bank'. The 'Query Editor' pane contains the following SQL code:

```
1 CREATE OR REPLACE VIEW DONATIONS_PACKETS AS
2 SELECT * FROM DONATION_CAMP NATURAL JOIN BLOOD_PACKET;
3 SELECT * FROM DONATIONS_PACKETS;
```

The 'Data Output' tab shows the results of the query, which is a Cartesian product of the two tables. The columns are: camp_id, event_date, location, start_time, end_time, packet_id, capacity, and donor_id. The data is as follows:

	camp_id	event_date	location	start_time	end_time	packet_id	capacity	donor_id
1	1	2018-01-10	Ahmedabad	09:00:00	17:00:00	1	200	66
2	1	2018-01-10	Ahmedabad	09:00:00	17:00:00	2	300	10
3	1	2018-01-10	Ahmedabad	09:00:00	17:00:00	3	300	12
4	1	2018-01-10	Ahmedabad	09:00:00	17:00:00	4	100	70
5	1	2018-01-10	Ahmedabad	09:00:00	17:00:00	5	100	36
6	1	2018-01-10	Ahmedabad	09:00:00				

The status bar at the bottom right indicates: Successfully run. Total query runtime: 395 msec. 300 rows affected.

TOP CITY IN 2017 IN TERMS OF DONATION:

```
18. SELECT LOCATION, SUM(CAPACITY) AS DONATIONS  
    FROM DONATIONS_PACKETS  
   WHERE EXTRACT(YEAR FROM EVENT_DATE) = '2017'  
GROUP BY LOCATION  
ORDER BY DONATIONS DESC  
LIMIT 1;
```

The screenshot shows the PGAdmin 4 interface. The left sidebar displays the database structure under 'Servers (1)'. The '201801403_db' database is selected, showing its contents: 'Casts', 'Catalogs (2)', 'ANSI (information_schema)', 'PostgreSQL Catalog (pg_...)', 'Event Triggers', 'Extensions (1)', 'plpgsql', 'Foreign Data Wrappers', 'Languages', 'Schemas (3)', 'airline', and 'blood_bank'. The 'blood_bank' schema is currently expanded, listing 'Collations', 'Domains', 'FTS Configurations', 'FTS Dictionaries', 'FTS Parsers', 'FTS Templates', 'Foreign Tables', 'Functions', and 'Materialized Views'. The main area contains the SQL query:

```
1 SELECT LOCATION, SUM(CAPACITY) AS DONATIONS  
2 FROM DONATIONS_PACKETS  
3 WHERE EXTRACT(YEAR FROM EVENT_DATE) = '2017'  
4 GROUP BY LOCATION  
5 ORDER BY DONATIONS DESC  
6 LIMIT 1;  
7
```

The 'Data Output' tab shows the results of the query:

location	donations
Ahmedabad	6800

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 293 msec. 1 rows affected."

GET THE DETAILS OF STAFF MEMBERS WITH THEIR CONTRIBUTION IN DIFFERENT BLOOD DONATION CAMP

```
19. SELECT STAFF_ID, NAME, COUNT(CAMP_ID)
   FROM STAFF NATURAL JOIN DONATION_CAMP
  GROUP BY STAFF_ID;
```

```
201801403_db/postgres@PostgreSQL 10 *
```

staff_id	name	count
11	Hyacinth	30
9	Quin	30
3	Laith	30
5	Lance	30
4	Audra	30
6	Jamal	30
7	Amelia	30

Successfully run. Total query runtime: 299 msec. 14 rows affected.

GET THE DETAILS AND COUNT OF ALL DOCTORS WHO HAVE REQUESTED FOR BLOOD:

```
20. SELECT DOCTOR_ID, COUNT(*) AS REFERRALS  
FROM DOCTOR NATURAL JOIN TRANSFUSION  
GROUP BY DOCTOR_ID  
ORDER BY DOCTOR_ID;
```

The screenshot shows the pgAdmin 4 interface. On the left is a tree view of database objects under 'Servers (1) > PostgreSQL 10 > Databases (2) > 201801403_db'. The 'blood_bank' schema is selected. In the center, the 'Query Editor' tab contains the SQL query from above. Below it, the 'Data Output' tab shows the results in a table:

doctor_id	referrals
1	13
2	9
3	14
4	15
5	11
6	12
7	11

A green status bar at the bottom right indicates: 'Successfully run. Total query runtime: 212 msec. 20 rows affected.'

FOR ALL CAMP, RETURN NUMBER OF STAFF MEMBER HAVING MORE THAN 5 YEARS OF EXPERIENCE

```
21. SELECT DONATION_CAMP.CAMP_ID, COUNT(STAFF_ID) AS  
      FIVE_YEAR_EXPERIENCE  
   FROM DONATION_CAMP NATURAL JOIN TEAM NATURAL JOIN STAFF  
  WHERE (DATE_OF_JOINING + INTERVAL '5 YEAR') <= EVENT_DATE  
 GROUP BY DONATION_CAMP.CAMP_ID  
ORDER BY DONATION_CAMP.CAMP_ID;
```

The screenshot shows the PgAdmin 4 interface. The left sidebar displays the database structure under 'Servers (1)'. The 'Query Editor' tab contains the SQL query from above. The 'Data Output' tab shows the results of the query:

camp_id	five_year_experience
1	1
2	2
3	3
4	4
5	5
6	9
7	10

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 291 msec. 25 rows affected."

GET ALL THE DETAILS OF INVENTORY USED IN CAMPS CONDUCTED AFTER 2020:

```
22. SELECT RESULT.CAMP_ID, RESULT.NAME,RESULT.TYPE, RESULT.COUNT  
      FROM (SELECT * FROM DONATION_CAMP NATURAL JOIN INVENTORY NATURAL  
            JOIN ITEM  
      WHERE EXTRACT(YEAR FROM EVENT_DATE) > 2005)  
      AS RESULT;
```

The screenshot shows the PGAdmin 4 interface. The left sidebar displays the database structure under 'Servers' and '201801403_db'. The main area has a 'Query Editor' tab with the following SQL code:

```
1  SELECT RESULT.CAMP_ID, RESULT.NAME,RESULT.TYPE, RESULT.COUNT  
2  FROM (SELECT * FROM DONATION_CAMP NATURAL JOIN INVENTORY NATURAL JOIN ITEM  
3  WHERE EXTRACT(YEAR FROM EVENT_DATE) > 2005)  
4  AS RESULT;  
5
```

The 'Data Output' tab shows the results of the query:

	camp_id	name	type	count
1	1	Gloves	Plastic	12
2	1	Gloves	Rubber	10
3	1	Syringe	5mm	6
4	1	Syringe	10mm	15
5	1	Injection	10ml	13
6	1	Injection	50ml	6
7	1	Blood_pouch	100ml	14

A green message bar at the bottom right indicates: "Successfully run. Total query runtime: 203 msec. 300 rows affected."

GET THE COUNT OF DONORS IN EACH DONATION CAMP:

```
23. SELECT CAMP_ID, COUNT(DONOR_ID)
   FROM DONATION_CAMP NATURAL JOIN BLOOD_PACKET
  GROUP BY CAMP_ID
 ORDER BY CAMP_ID;
```

The screenshot shows the pgAdmin 4 interface. On the left is the 'Browser' pane, which displays the database structure under 'Servers (1) > PostgreSQL 10 > Databases (2) > 201801403_db'. Inside this database, several objects are listed: Casts, Catalogs (2), ANSI (information_schema), PostgreSQL Catalog (pg_), Event Triggers, Extensions (1) including plpgsql, Foreign Data Wrappers, Languages, Schemas (3) including airline, and blood_bank. The 'blood_bank' schema is currently selected. The main area is the 'Query Editor' tab, showing the SQL query from above. Below the query is the 'Data Output' tab, which displays a table with two columns: camp_id [PK] integer and count bigint. The data is as follows:

camp_id	count
1	13
2	11
3	7
4	13
5	10
6	10
7	7

A green status bar at the bottom right indicates: ✓ Successfully run. Total query runtime: 319 msec. 30 rows affected.

GET THE COUNT OF DONORS OF 'A+' IN EACH DONATION CAMP:

```
24. SELECT CAMP_ID, COUNT(DONOR_ID)
   FROM DONATION_CAMP
   NATURAL JOIN BLOOD_PACKET
   NATURAL JOIN BLOOD_REPORT
   WHERE BLOOD_GROUP = 'A+'
   GROUP BY CAMP_ID
   ORDER BY CAMP_ID;
```

The screenshot shows the pgAdmin 10 interface. On the left is the 'Browser' pane, which displays the database structure under 'Servers (1)'. A tree view shows 'PostgreSQL 10' and '201801403_db' with various objects like 'Casts', 'Catalogs', 'Event Triggers', 'Extensions', 'Schemas', and 'blood_bank'. The 'blood_bank' schema is currently selected. The main area is the 'Query Editor' tab, containing the SQL query from above. Below the editor is the 'Data Output' tab, which displays a table with the results:

camp_id	count
1	5
2	6
3	7
4	12
5	16
6	17
7	19

A green message bar at the bottom right indicates: 'Successfully run. Total query runtime: 269 msec. 12 rows affected.'

TOP CITY IN 2019 IN TERMS OF DONATION:

```
25. SELECT LOCATION, SUM(CAPACITY) AS DONATIONS  
      FROM DONATIONS_PACKETS  
     WHERE EXTRACT(YEAR FROM EVENT_DATE) = '2019'  
   GROUP BY LOCATION  
 ORDER BY DONATIONS DESC  
LIMIT 1;
```

The screenshot shows the PgAdmin 4 interface. On the left is the 'Browser' pane, which lists the database structure under 'Servers (1) > PostgreSQL 10 > Databases (2) > 201801403_db > Schemas (3) > blood_bank'. The 'Query Editor' tab is active, displaying the SQL query from above. The 'Data Output' tab shows a single row of data: location (Mumbai) and donations (2100). A green message bar at the bottom right indicates 'Successfully run. Total query runtime: 197 msec. 1 rows affected.'

location	donations
Mumbai	2100

TOP 5 CITIES IN DONATION:

```
26. SELECT LOCATION, SUM(CAPACITY) AS DONATIONS  
      FROM DONATIONS_PACKETS  
      GROUP BY LOCATION  
      SORT BY DONATIONS DESC  
      LIMIT 5;
```

The screenshot shows the pgAdmin 4 interface. The left sidebar displays the database structure under 'Servers (1) > PostgreSQL 10 > Databases (2) > 201801403_db'. The 'blood_bank' schema is selected. The main area contains a 'Query Editor' tab with the following SQL code:

```
1 SELECT LOCATION, SUM(CAPACITY) AS DONATIONS  
2 FROM DONATIONS_PACKETS  
3 GROUP BY LOCATION  
4 ORDER BY DONATIONS DESC  
5 LIMIT 5;
```

The 'Data Output' tab shows the results of the query:

location	donations
Ahmedabad	24100
Delhi	10100
Los Angeles	8100
Mumbai	6500
Kolkata	5900

A green message bar at the bottom right indicates: ✓ Successfully run. Total query runtime: 275 msec. 5 rows affected.

A Trigger to update the inventory when a donor donates and items are used

```
27. CREATE OR REPLACE FUNCTION ADD_INVENTORY()
RETURNS TRIGGER AS
$$
DECLARE
x record;
BEGIN
    IF NEW.CAPACITY = 100 THEN
        UPDATE INVENTORY
        SET COUNT = COUNT + 1
        WHERE ITEM_ID = 7 OR ITEM_ID = 3 OR ITEM_ID = 5;
    ELSEIF NEW.CAPACITY = 200 THEN
        UPDATE INVENTORY
        SET COUNT = COUNT + 1
        WHERE ITEM_ID = 8 OR ITEM_ID = 4 OR ITEM_ID = 6;
    ELSE
        UPDATE INVENTORY
        SET COUNT = COUNT + 1
        WHERE ITEM_ID = 9 OR ITEM_ID = 4 OR ITEM_ID = 6;
    END IF;
    RETURN NEW;
END;
$$ LANGUAGE plpgsql;
```

```
CREATE TRIGGER ADD_INVENT AFTER INSERT ON BLOOD_PACKET
FOR EACH ROW EXECUTE PROCEDURE ADD_INVENTORY();
```

```
SELECT *
FROM INVENTORY
WHERE CAMP_ID = 25
```

```
INSERT INTO BLOOD_PACKET(CAPACITY, CAMP_ID, DONOR_ID, USAGE_TYPE)
VALUES(200, 25, 26, 'General');
```

```
SELECT *
FROM INVENTORY
WHERE CAMP_ID = 25
```

Before:

The screenshot shows a PostgreSQL query editor window. The left pane displays a SQL script for creating a trigger named ADD_INVENT. The right pane shows the results of a query against a table named BLOOD_PACKET, which has columns camp_id, item_id, and count. The data is as follows:

camp_id	item_id	count
1	25	1
2	25	2
3	25	3
4	25	5
5	25	7
6	25	9
7	25	10
8	25	4
9	25	6
10	25	8

At the bottom of the editor, there is a message: "meet.google.com is sharing your screen." and a status bar indicating "Successfully run. Total query runtime: 89 msec. 10 rows affected."

```

5 x record;
6 BEGIN
7   IF NEW.CAPACITY = 100 THEN
8     UPDATE INVENTORY
9     SET COUNT = COUNT + 1
10    WHERE ITEM_ID = 7 OR ITEM_ID = 3 OR ITEM_ID = 5;
11  ELSEIF NEW.CAPACITY = 200 THEN
12    UPDATE INVENTORY
13    SET COUNT = COUNT + 1
14    WHERE ITEM_ID = 8 OR ITEM_ID = 4 OR ITEM_ID = 6;
15  ELSE
16    UPDATE INVENTORY
17    SET COUNT = COUNT + 1
18    WHERE ITEM_ID = 9 OR ITEM_ID = 4 OR ITEM_ID = 6;
19  END IF;
20  RETURN NEW;
21 END;
22 $$ LANGUAGE plpgsql;
23
24 CREATE TRIGGER ADD_INVENT AFTER INSERT ON BLOOD_PACKET
25 FOR EACH ROW EXECUTE PROCEDURE ADD_INVENTORY();
26
27 SELECT *
28 FROM INVENTORY
29 WHERE CAMP_ID = 25;
30
31 INSERT INTO BLOOD_PACKET(CAPACITY, CAMP_ID, DONOR_ID, USAGE_TYPE) VALUES(200, 25, 26, 'General');
32
33 SELECT *
34 FROM INVENTORY
35 WHERE CAMP_ID = 25;
36
37
38

```

After:

The screenshot shows a PostgreSQL query editor window. The left pane displays a modified SQL script where the value 200 is changed to 300 in the INSERT statement. The right pane shows the results of a query against the BLOOD_PACKET table, which now includes an additional row with camp_id 10 and item_id 25, count 14.

camp_id	item_id	count
1	25	1
2	25	2
3	25	3
4	25	5
5	25	7
6	25	10
7	25	9
8	25	8
9	25	4
10	25	6
11	25	14

At the bottom of the editor, there is a message: "meet.google.com is sharing your screen." and a status bar indicating "Successfully run. Total query runtime: 69 msec. 10 rows affected."

```

7   IF NEW.CAPACITY = 100 THEN
8     UPDATE INVENTORY
9     SET COUNT = COUNT + 1
10    WHERE ITEM_ID = 7 OR ITEM_ID = 3 OR ITEM_ID = 5;
11  ELSEIF NEW.CAPACITY = 200 THEN
12    UPDATE INVENTORY
13    SET COUNT = COUNT + 1
14    WHERE ITEM_ID = 8 OR ITEM_ID = 4 OR ITEM_ID = 6;
15  ELSE
16    UPDATE INVENTORY
17    SET COUNT = COUNT + 1
18    WHERE ITEM_ID = 9 OR ITEM_ID = 4 OR ITEM_ID = 6;
19  END IF;
20  RETURN NEW;
21 END;
22 $$ LANGUAGE plpgsql;
23
24 CREATE TRIGGER ADD_INVENT AFTER INSERT ON BLOOD_PACKET
25 FOR EACH ROW EXECUTE PROCEDURE ADD_INVENTORY();
26
27 SELECT *
28 FROM INVENTORY
29 WHERE CAMP_ID = 25;
30
31 select * from item;
32
33 INSERT INTO BLOOD_PACKET(CAPACITY, CAMP_ID, DONOR_ID, USAGE_TYPE) VALUES(300, 25, 26, 'General');
34
35 SELECT *
36 FROM INVENTORY
37 WHERE CAMP_ID = 25;
38
39
40

```

Calculate cost of inventory every year

```
28. SELECT COUNTS.DT, SUM(COUNTS.SUM * ITEM.PRICE)
   FROM (
      SELECT EXTRACT(YEAR FROM DONATION_CAMP.EVENT_DATE) AS DT,
ITEM_ID, SUM(INVENTORY.COUNT)
      FROM DONATION_CAMP,INVENTORY
     WHERE DONATION_CAMP.CAMP_ID = INVENTORY.CAMP_ID
      GROUP BY ITEM_ID, EXTRACT(YEAR FROM EVENT_DATE)
      ORDER BY ITEM_ID
   ) AS COUNTS NATURAL JOIN ITEM
  GROUP BY COUNTS.DT
  ORDER BY COUNTS.DT
```

The screenshot shows a PostgreSQL query editor interface. The query in the editor is:

```
1  SELECT COUNTS.DT, SUM(COUNTS.SUM * ITEM.PRICE)
2  FROM (
3    SELECT EXTRACT(YEAR FROM DONATION_CAMP.EVENT_DATE) AS DT, ITEM_ID, SUM(INVENTORY.COUNT)
4    FROM DONATION_CAMP,INVENTORY
5    WHERE DONATION_CAMP.CAMP_ID = INVENTORY.CAMP_ID
6    GROUP BY ITEM_ID, EXTRACT(YEAR FROM EVENT_DATE)
7    ORDER BY ITEM_ID
8  ) AS COUNTS NATURAL JOIN ITEM
9  GROUP BY COUNTS.DT
10 ORDER BY COUNTS.DT
```

The results are displayed in a table:

dt	sum
2016	14790
2017	116340
2018	155700
2019	33205
2020	171665

A message at the bottom right indicates: ✓ Successfully run. Total query runtime: 161 msec. 5 rows affected.

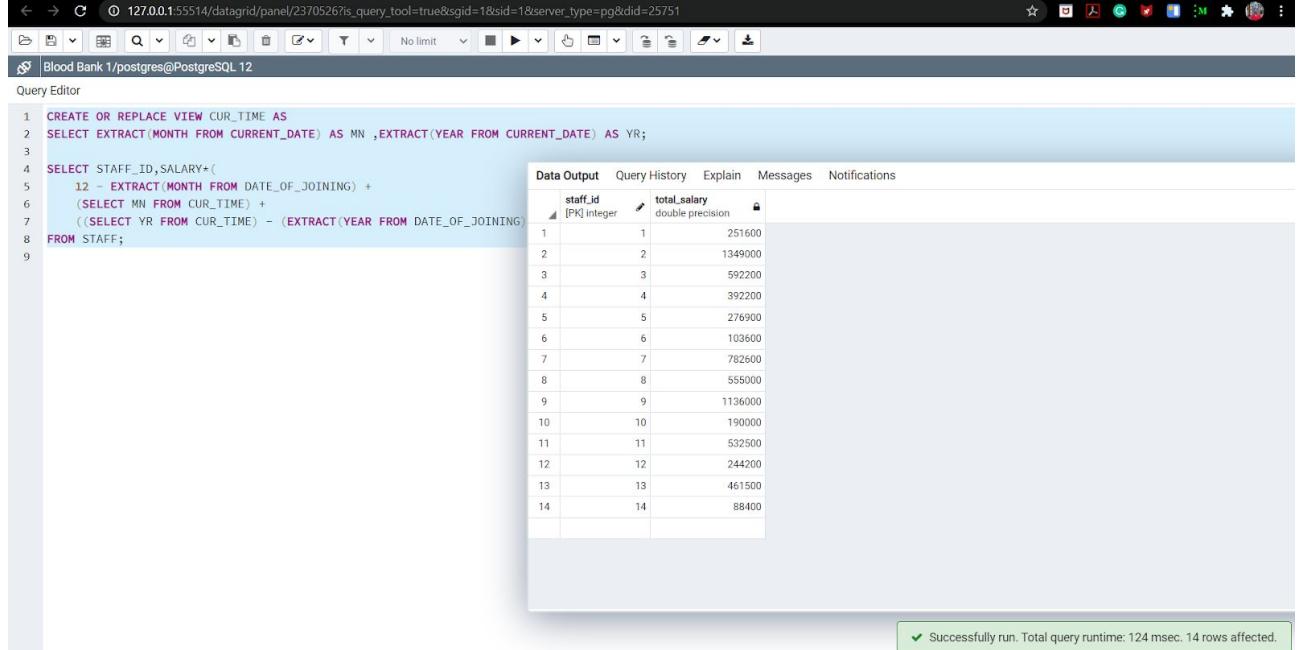

Display Total Salary Received by each Staff Member till date

29. CREATE OR REPLACE VIEW CUR_TIME AS

```
SELECT EXTRACT(MONTH FROM CURRENT_DATE) AS MN ,EXTRACT(YEAR FROM CURRENT_DATE) AS YR
```

```
SELECT STAFF_ID,SALARY*(
12 - EXTRACT(MONTH FROM DATE_OF_JOINING) +
(SELECT MN FROM CUR_TIME) +
((SELECT YR FROM CUR_TIME) - (EXTRACT(YEAR FROM DATE_OF_JOINING)) -
1)*12) AS TOTAL_SALARY
```

```
FROM STAFF
```

staff_id	total_salary
1	251600
2	1349000
3	592200
4	392200
5	276900
6	103600
7	782600
8	555000
9	1136000
10	190000

12	244200
13	461500
14	88400

✓ Successfully run. Total query runtime: 124 msec. 14 rows affected.

Display % of Packets for Each Category of USAGE_TYPE

30. select usage_type,(cast(count(*) as decimal)*100/(select count(*) from blood_packet)) from blood_packet
group by usage_type

The screenshot shows a PostgreSQL query editor interface. The URL in the address bar is 127.0.0.1:55514/datagrid/panel/2370526?is_query_tool=true&sgid=1&sid=1&server_type=pg&did=25751. The title bar says "Blood Bank 1/postgres@PostgreSQL 12". The Query Editor contains the following SQL code:

```
1 select usage_type,(cast(count(*) as decimal)*100/(select count(*) from blood_packet)) from blood_packet
2 group by usage_type
3
```

The Data Output tab shows the results of the query:

usage_type	?column?
character varying (10)	numeric
1 Personal	31.33333333333333
2 Relatives	36.666666666666667
3 General	32.00000000000000

A message at the bottom right of the results pane says "Successfully run. Total query runtime: 115 msec. 3 rows affected."

Display the Inventory Cost of Each Camp

```
31. SELECT COUNTS.CAMP_ID, SUM(COUNTS.SUM * ITEM.PRICE)
   FROM (
      SELECT DONATION_CAMP.CAMP_ID,ITEM_ID, SUM(INVENTORY.COUNT)
      FROM DONATION_CAMP,INVENTORY
     WHERE DONATION_CAMP.CAMP_ID = INVENTORY.CAMP_ID
    GROUP BY ITEM_ID,DONATION_CAMP.CAMP_ID
    ORDER BY ITEM_ID
   ) AS COUNTS NATURAL JOIN ITEM
  GROUP BY COUNTS.CAMP_ID
  ORDER BY COUNTS.CAMP_ID
```

The screenshot shows a PostgreSQL query editor interface. The top bar includes standard browser-style controls (back, forward, search, etc.) and a tab labeled "Data Output". Below the toolbar is a navigation bar with icons for file operations like Open, Save, and Print. The main area is divided into two sections: a "Query Editor" on the left containing the SQL code, and a "Data Output" table on the right.

Query Editor:

```
1  SELECT COUNTS.CAMP_ID, SUM(COUNTS.SUM * ITEM.PRICE)
2  FROM (
3    SELECT DONATION_CAMP.CAMP_ID,ITEM_ID, SUM(INVENTORY.COUNT)
4    FROM DONATION_CAMP,INVENTORY
5   WHERE DONATION_CAMP.CAMP_ID = INVENTORY.CAMP_ID
6   GROUP BY ITEM_ID,DONATION_CAMP.CAMP_ID
7   ORDER BY ITEM_ID
8  ) AS COUNTS NATURAL JOIN ITEM
9  GROUP BY COUNTS.CAMP_ID
10 ORDER BY COUNTS.CAMP_ID
```

Data Output:

camp_id	sum
1	16795
2	13900
3	14920
4	11510
5	15065
6	17235
7	17580
8	12530
9	17115
10	18865
11	14515
12	15120

14	16710
15	16505
16	18840
17	22110
18	14715
19	19375
20	17235
21	18050
22	17490
23	18675
24	14425
25	16035
26	14755
27	14790

Status Bar: Successfully run. Total query runtime: 120 msec. 30 rows affected.

Rank the Cities Based on the Number of Camps Held

```
32. SELECT LOCATION,COUNT(*)  
      FROM DONATION_CAMP  
      GROUP BY LOCATION  
      ORDER BY COUNT(*) DESC
```

The screenshot shows a PostgreSQL query tool interface. The top bar includes navigation icons and the URL `127.0.0.1:55514/datagrid/panel/2370526?is_query_tool=true&sgid=1&sid=1&server_type=pg&did=25751`. Below the toolbar are tabs for Data Output, Query History, Explain, Messages, and Notifications. The main area has a title bar "Blood Bank 1/postgres@PostgreSQL 12". The left pane is a Query Editor containing the following SQL code:

```
1 SELECT LOCATION,COUNT(*)  
2 FROM DONATION_CAMP  
3 GROUP BY LOCATION  
4 ORDER BY COUNT(*) DESC  
5
```

The right pane displays the Data Output table:

location	count
Ahmedabad	12
Mumbai	4
Delhi	4
Kolkata	4
Chicago	3
Los Angeles	3

In the bottom right corner of the main pane, there is a green success message: `✓ Successfully run. Total query runtime: 165 msec. 6 rows affected.`

Rank the Doctors Based on the Number of Patients Sent

```
33. SELECT DOCTOR_ID,COUNT(*)  
      FROM TRANSFUSION  
      GROUP BY DOCTOR_ID  
      ORDER BY COUNT(*) DESC
```

The screenshot shows a PostgreSQL query tool interface. The query editor contains the following SQL code:

```
1 SELECT DOCTOR_ID,COUNT(*)  
2 FROM TRANSFUSION  
3 GROUP BY DOCTOR_ID  
4 ORDER BY COUNT(*) DESC  
5
```

The results are displayed in a data grid:

doctor_id	count
1	12
2	11
3	18
4	10
5	4
6	9
7	17
8	3
9	13
10	1
11	6
12	7
13	5
14	15
15	14
16	20
17	16
18	2
19	8
20	19

A message at the bottom right indicates: "Successfully run. Total query runtime: 117 msec. 20 rows affected."

List down the Donors with a Normal Blood Sugar Level (below 140)

```
34. SELECT DONOR.NAME, DONOR.MOBILE  
      FROM DONOR  
      INNER JOIN BLOOD_PACKET ON  
DONOR.DONOR_ID = BLOOD_PACKET.DONOR_ID  
      INNER JOIN BLOOD_REPORT ON  
BLOOD_PACKET.PACKET_ID = BLOOD_REPORT.PACKET_ID  
      WHERE BLOOD_REPORT.SUGAR_LEVEL < '140'
```

The screenshot shows a PostgreSQL Data Grid interface with the following details:

- URL:** 127.0.0.1:55514/datagrid(panel/2370526?is_query_tool=true&sgid=1&sid=1&server_type=pg&did=25751)
- Table:** Blood Bank 1/postgres@PostgreSQL 12
- Columns:** name (character varying (20)), mobile (character varying (10))
- Rows:** 27 rows listed, starting with Barron Le Marchand and ending with Correna MacGarvey.
- Status Bar:** Successfully run. Total query runtime: 242 msec. 149 rows affected.

	name	mobile

Return the Packet ID of the oldest unused blood packet with blood group A+

```
35. SELECT BLOOD_PACKET.PACKET_ID
   FROM BLOOD_PACKET NATURAL JOIN BLOOD_REPORT NATURAL JOIN
   DONATION_CAMP
  WHERE BLOOD_PACKET.PACKET_ID NOT IN(SELECT TRANSFUSION.PACKET_ID
   FROM TRANSFUSION)
  AND BLOOD_REPORT.BLOOD_GROUP='A+'
  AND DONATION_CAMP.EVENT_DATE <= ALL(SELECT EVENT_DATE FROM
   DONATION_CAMP);
```

The screenshot shows a PostgreSQL query editor interface. The top bar displays the URL `127.0.0.1:55514/datagrid/panel/2370526?is_query_tool=true&sgid=1&sid=1&server_type=pg&did=25751`. Below the toolbar, the title bar says "Blood Bank 1/postgres@PostgreSQL 12". The main area is divided into two panes: "Query Editor" on the left and "Data Output" on the right.

In the Query Editor pane, the following SQL code is visible:

```
1 SELECT BLOOD_PACKET.PACKET_ID
2   FROM BLOOD_PACKET NATURAL JOIN BLOOD_REPORT NATURAL JOIN DONATION_CAMP
3  WHERE BLOOD_PACKET.PACKET_ID NOT IN(SELECT TRANSFUSION.PACKET_ID
4   FROM TRANSFUSION)
5  AND BLOOD_REPORT.BLOOD_GROUP='A+'
6  AND DONATION_CAMP.EVENT_DATE <= ALL(SELECT EVENT_DATE FROM DONATION_CAMP)
```

In the Data Output pane, there is a single row in a table:

packet_id
1

A message at the bottom right of the interface states: "Successfully run. Total query runtime: 140 msec. 1 rows affected."

Number of Patients who received blood from a particular donor

```
36. SELECT DONOR_ID, COUNT(PATIENT_ID) AS TRANSFUSIONS  
      FROM TRANSFUSION NATURAL JOIN BLOOD_PACKET NATURAL JOIN DONOR  
     GROUP BY DONOR_ID  
    ORDER BY DONOR_ID;
```

The screenshot shows a PostgreSQL query editor interface. The URL in the address bar is `127.0.0.1:55514/datagrid/panel/2370526?is_query_tool=true&sgid=1&sid=1&server_type=pg&did=25751`. The title bar says "Blood Bank 1/postgres@PostgreSQL 12". The main area is a "Query Editor" with the following SQL code:

```
1 SELECT DONOR_ID, COUNT(PATIENT_ID) AS TRANSFUSIONS  
2 FROM TRANSFUSION NATURAL JOIN BLOOD_PACKET NATURAL JOIN DONOR  
3 GROUP BY DONOR_ID  
4 ORDER BY DONOR_ID;
```

Below the code, there's a "Data Output" tab selected, showing a table with two columns: "donor_id" and "transfusions". The data is as follows:

donor_id	transfusions
1	1
2	3
3	4
4	5
5	6
6	7
7	9
8	10
9	11
10	12
11	13
12	14
13	15
14	16
15	17
16	19
17	20
18	21

In the bottom right corner of the data output area, there is a green success message: "Successfully run. Total query runtime: 166 msec. 85 rows affected."

Number of blood packets of each blood group used in transfusion

```
37. SELECT BLOOD_GROUP, COUNT(TRANSFUSION.TIME_STAMP)
   FROM TRANSFUSION NATURAL JOIN BLOOD_PACKET, BLOOD_REPORT
  WHERE BLOOD_PACKET.PACKET_ID = BLOOD_REPORT.PACKET_ID
 GROUP BY BLOOD_GROUP;
```

The screenshot shows a PostgreSQL query editor interface. The top bar displays the URL: 127.0.0.1:55514/datagrid/panel/2370526?is_query_tool=true&sgid=1&sid=1&server_type=pg&did=25751. Below the toolbar, the title bar says "Blood Bank 1/postgres@PostgreSQL 12". The main area is a "Query Editor" containing the following SQL code:

```
1 SELECT BLOOD_GROUP, COUNT(TRANSFUSION.TIME_STAMP)
2 FROM TRANSFUSION NATURAL JOIN BLOOD_PACKET, BLOOD_REPORT
3 WHERE BLOOD_PACKET.PACKET_ID = BLOOD_REPORT.PACKET_ID
4 GROUP BY BLOOD_GROUP;
5
```

Below the code, there are tabs for "Data Output", "Query History", "Explain", "Messages", and "Notifications". The "Data Output" tab is selected, showing a table with two columns: "blood_group" and "count". The data is as follows:

blood_group	count
B+	39
O-	40
AB+	42
AB-	50
A+	18
O+	41
B-	30
A-	23

In the bottom right corner of the results area, there is a green checkmark icon with the text "Successfully run. Total query runtime: 113 msec. 8 rows affected."

Number of Donations with Blood Group A+ from each location

```
38. SELECT LOCATION, COUNT(BLOOD_GROUP)
   FROM DONATION_CAMP NATURAL JOIN BLOOD_PACKET NATURAL JOIN
   BLOOD_REPORT
   WHERE BLOOD_GROUP = 'A+'
   GROUP BY LOCATION;
```

The screenshot shows a PostgreSQL query editor interface. The query in the editor is:

```
1 SELECT LOCATION, COUNT(BLOOD_GROUP)
2 FROM DONATION_CAMP NATURAL JOIN BLOOD_PACKET NATURAL JOIN BLOOD_REPORT
3 WHERE BLOOD_GROUP = 'A+'
4 GROUP BY LOCATION;
5
```

The results are displayed in a table:

location	count
Los Angeles	5
Kolkata	4
Ahmedabad	8
Chicago	2
Delhi	2

At the bottom right, there is a message: "Successfully run. Total query runtime: 134 msec. 5 rows affected."

Number of healthy donors i.e. platelet count between 150000 and 350000, WBC between 4000 and 12000, RBC between 4 and 7, Haemoglobin between 13 and 17, Sugar level less than 140.

39. **SELECT COUNT(*) FROM BLOOD_REPORT
WHERE (PLATELETS > '150000') AND (PLATELETS < '350000') AND
(WBC_COUNT > '4000') AND (WBC_COUNT < '12000') AND
(RBC_COUNT > '4') AND (RBC_COUNT < '7') AND
(HAEMOGLOBIN > '13') AND (HAEMOGLOBIN < '17') AND
(SUGAR_LEVEL < '140')**

The screenshot shows a PostgreSQL query editor interface. The top bar displays the URL: 127.0.0.1:55514/datagrid/panel/2370526?is_query_tool=true&sgid=1&sid=1&server_type=pg&did=25751. Below the toolbar, the connection information is shown: Blood Bank 1/postgres@PostgreSQL 12. The main area is a Query Editor containing the following SQL code:

```
1 SELECT COUNT(*) FROM BLOOD_REPORT
2 WHERE (PLATELETS > '150000') AND (PLATELETS < '350000') AND
3   (WBC_COUNT > '4000') AND (WBC_COUNT < '12000') AND
4   (RBC_COUNT > '4') AND (RBC_COUNT < '7') AND
5   (HAEMOGLOBIN > '13') AND (HAEMOGLOBIN < '17') AND
6   (SUGAR_LEVEL < '140')
7
```

Below the code, the Data Output tab is selected, showing a single row of results:

count	bigint
1	32

A green success message at the bottom right indicates: ✓ Successfully run. Total query runtime: 128 msec. 1 rows affected.

List of Patient and Donor of Each Transfusion

```
40. SELECT DONOR.NAME AS DONOR, PATIENT.NAME AS PATIENT  
      FROM DONOR NATURAL JOIN BLOOD_PACKET, TRANSFUSION, PATIENT  
     WHERE BLOOD_PACKET.PACKET_ID = TRANSFUSION.PACKET_ID AND  
          TRANSFUSION.PATIENT_ID = PATIENT.PATIENT_ID;
```

The screenshot shows a PostgreSQL query editor interface. The URL in the address bar is 127.0.0.1:55514/datagrid/panel/2370526?is_query_tool=true&sgid=18&sid=18&server_type=pg&cid=25751. The title bar says "Blood Bank 1/postgres@PostgreSQL 12". The toolbar has various icons for file operations like save, open, and print. The main area is a "Query Editor" with the following content:

```
1 SELECT DONOR.NAME AS DONOR, PATIENT.NAME AS PATIENT  
2 FROM DONOR NATURAL JOIN BLOOD_PACKET, TRANSFUSION, PATIENT  
3 WHERE BLOOD_PACKET.PACKET_ID = TRANSFUSION.PACKET_ID AND  
4          TRANSFUSION.PATIENT_ID = PATIENT.PATIENT_ID;
```

Below the code, there are tabs for "Data Output", "Query History", "Explain", "Messages", and "Notifications". The "Data Output" tab is selected and displays a table with two columns: "donor" and "patient". The data consists of 25 rows, numbered 1 to 25. The "donor" column contains names like Bambie Martinon, Luce Andres, Wynn Syers, etc., and the "patient" column contains names like Maighdin, Petunia, Edythe, Sarene, Desirae, Joly, Olympe, Latia, Ardella, Betsey, Jorey, Crin, Lemmie Savage, Gill, Corette, Celle, Erna, Darci, Ebony, and Gille. A message at the bottom right of the table area says "Successfully run. Total query runtime: 76 msec. 250 rows affected."
